

Abstract of the Disclosure

A display device includes a case, which has a surface for supporting an article thereon, a plurality of light units and an activating mechanism for activating the  
5 light units in a predetermined manner. A supporting member is mounted in the case for supporting the light units therefrom such that at least one portion of each of the light units extends outwardly from the case. The supporting member has at least one printed circuit thereon for connecting the  
10 light units to the activating mechanism.
